6. Parch (number of parents/children on board): The mean is 0.3816, and the standard deviation is 0.8061. This suggests that a large number of passengers were traveling without any family members or with just one parent or child.

7. Fare: The mean fare is 32.20, but there's a significant range in fares due to the high standard deviation (49.69). This could indicate differences in affordability among passengers.

8. Minimum, quartile, and maximum values provide additional insights into the distribution of each feature:

- Survived: Most passengers did not survive (min=0, 25th percentile=0, median=0), but some did (75th percentile=1, max=1).
- Pclass: Passengers were primarily in third class (min=1, 25th percentile=2, median=3, 75th percentile=3).
- Age: The youngest passenger was 0.42 years old, and the oldest was 80 years old (quartiles suggest a distribution skewed towards younger ages).
- SibSp: Ranges from 0 to 8 passengers traveling together (median=0 indicates most traveled alone or with one other person).
- Parch: Ranges from 0 to 6 passengers traveling together (median=0 indicates most traveled alone or with just their parents/children).

Fare: Ranges from 0 to 512.32 (quartiles suggest a distribution skewed towards lower
